

Firecrawl Read-Only Proof Report

Generated: 2026-05-08 09:24 ET

Objective

Move Firecrawl from BLOCKED to connected/read-only only if an approved credential and safe backend adapter are actually available.

Final result: **BLOCKED**.

Firecrawl is still blocked for Mission Control. The production routes and Gateway node exist, and SpaceAgent can return a Firecrawl-aware ResearchPacket, but Mission Control does not have a Firecrawl credential in its service environment and the Firecrawl SDK/backend runner is not installed. No live Firecrawl scrape/crawl was executed.

Status Decision

System	Previous %	Updated %	Decision	Exact blocker
---	---	---	---	---
Firecrawl	35%	35%	BLOCKED	`firecrawl_credential_required`
SpaceAgent Firecrawl path	68-76% overall		SpaceAgent unchanged	PARTIAL / packet-only
Firecrawl packet can be prepared, but live Firecrawl call is blocked				
Gateway Firecrawl node	present	present	BLOCKED	`credential_required`

Do not mark Firecrawl GO. A live read-only smoke did not pass because the credential/backend prerequisites are missing from Mission Control.

Production Deploy Proof

The Firecrawl node alias fix was built and deployed to production from commit `89aa845`.

Check	Result
Previous Next listener PID	3293141
New Next listener PID	3317749
Login route after restart	HTTP 200
Deployed HEAD	`89aa845`
Public local service exposure	no new exposure; Next remains on local loopback with existing Tailnet proxy

Commands And Routes Used

Commands were run in a way that printed booleans and status only. No credential values, auth files, API keys, or token values were printed.

Production proof routes:

Route	Authenticated result	Unauthenticated result	Meaning
`GET /api/firecrawl/status`	200	401	Firecrawl status route exists and is protected
`GET /api/firecrawl/jobs`	200	401	Jobs route exists and is protected
`POST /api/firecrawl/jobs`	503	not run	unauthenticated Live job creation blocked by missing credential
`GET /api/bridge/connector-readiness`	200	401	Connector readiness route exists and is protected
`GET /api/gateway/nodes/firecrawl`	200	401	Direct Firecrawl node alias resolves to the Gateway Firecrawl node

```
| `GET /api/gateway/nodes/integration_firecrawl` | 200 | 401 | Gateway node exists under `integration_firecrawl` |
| `POST /api/gateway/space-agent/research` | 200 packet-only | not run unauthenticated | SpaceAgent can prepare a Firecrawl-aware ResearchPacket, but does not execute Firecrawl |
```

Safe public-page smoke target: `https://example.com/`.

No broad crawl, private page, login, external write, upload, memory write, or connector execution was run.

Credential Proof

Credential checks were boolean-only.

```
| Check | Result |
| --- | --- |
| Mission Control process has `FIRECRAWL_API_KEY` | no |
| Mission Control configured env source has `FIRECRAWL_API_KEY` by name | no |
| Related ClaudeClaw env source has `FIRECRAWL_API_KEY` by name | yes, value not inspected |
| Related OpenClaw+ env source has `FIRECRAWL_API_KEY` by name | yes, value not inspected |
| Mission Control Firecrawl SDK loaded | no |
| `.env` diff clean | yes |
```

Conclusion: an approved credential may exist in related OpenClaw+ runtime sources by name, but Mission Control does not currently have an approved credential in its own service environment. I did not copy, print, or read the secret value.

Required owner/admin next step: approve a secure credential sync path into Mission Control's protected service environment, then approve/wire the read-only Firecrawl backend adapter before rerunning smoke.

Backend Adapter Proof

Mission Control has a Firecrawl API surface:

```
- `GET /api/firecrawl/status`
- `GET /api/firecrawl/jobs`
- `POST /api/firecrawl/jobs`
- `GET /api/bridge/connector-readiness`
- `GET /api/gateway/nodes/integration_firecrawl`
```

However, the production job route intentionally blocks execution:

```
| Probe | Result |
| --- | --- |
| `POST /api/firecrawl/jobs` with `type=scrape` and public URL | HTTP 503 |
| Returned operation | no job created |
| Missing credential behavior | blocked safely |
| Firecrawl SDK/backend runner | not installed/wired |
```

If the credential becomes available before the backend runner is installed, the next blocker will be `firecrawl\_backend\_adapter\_not\_configured`.

Gateway And Agent Hub Status

Gateway exposes Firecrawl under node id `integration\_firecrawl`.

```
| Field | Production result |
| --- | --- |
```

```
| Node id | `integration_firecrawl` |
| Label | Firecrawl |
| Status | blocked |
| Read enabled | false |
| Write enabled | false |
| Execution enabled | false |
| Requires Bridge Session | true |
| Blocked reason | `credential_required` |
```

This is honest and safe. Gateway is not claiming live Firecrawl access. I also added the safe alias so `GET /api/gateway/nodes/firecrawl`` returns the same blocked Firecrawl node instead of a 404.

SpaceAgent ResearchPacket Proof

SpaceAgent was asked to prepare a Firecrawl-oriented packet for a public page. It did not execute Firecrawl.

```
| Field | Result |
| --- | --- |
| HTTP status | 200 |
| `ok` | true |
| Packet status | ready |
| Firecrawl status in packet | blocked missing credential |
| Blocked reason | `firecrawl_missing_credential_research_packet_can_still_use_browser_or_web_fallback_if_available` |
| Research performed | false |
| Evidence count | 0 |
| Web source count | 0 |
| External writes | none |
```

Interpretation: SpaceAgent can model and return the route/packet, but Firecrawl itself remains blocked. This is not Firecrawl GO.

Files Changed

```
| File | Purpose |
| --- | --- |
| `src/lib/gateway-registry-api.ts` | Adds the safe `firecrawl` node-detail alias to `integration_firecrawl` |
| `src/lib/gateway-registry-api.test.ts` | Verifies the alias returns a blocked, non-executing Firecrawl node |
| `runtime/firecrawl-readonly-proof-report.md` | Required Firecrawl proof report |
| `runtime/firecrawl-readonly-proof-report.pdf` | Required PDF report |
```

No `.env`` file, auth file, or credential file was changed.

Tests

```
| Check | Result |
| --- | --- |
| `git diff --check` | PASS |
| Focused Firecrawl/Gateway/SpaceAgent tests | PASS: 5 files, 37 tests |
| Typecheck | PASS after Next generated types were rebuilt |
| Build | PASS |
| `.env` diff check | PASS: clean |
| Production authenticated route smoke | PASS for Firecrawl status, jobs, connector readiness, Gateway node, SpaceAgent research |
| Production unauthenticated route smoke | PASS: protected routes returned 401 |
```

Focused tests run:

- `src/lib/space-agent-routes.test.ts`
- `src/lib/gateway-pi-dispatcher.test.ts`
- `src/lib/gateway-route-planner.test.ts`
- `src/lib/gateway-model.test.ts`
- `src/lib/gateway-registry-api.test.ts`

Blockers

Blocker	Status	Required next action
`firecrawl_credential_required`	active	Owner/admin approves secure credential sync into Mission Control service environment
`firecrawl_backend_adapter_not_configured`	pending	after credential is installed and wire the Firecrawl SDK/read-only runner and job persistence safely
Live read-only smoke	not run	Rerun only after credential and backend adapter are present

Rollback

Runtime behavior changed only for the safe read-only Gateway node alias. It does not enable Firecrawl execution or writes.

1. Revert the Firecrawl alias/report commit.
2. Restart the Mission Control runtime only if the code rollback is deployed.
3. Firecrawl will remain blocked either way until the credential/backend prerequisites are actually present.

No-Secrets Confirmation

- No Firecrawl credential value was printed.
- No auth file was printed.
- No API key or token value was printed.
- No `.env` file was modified.
- No external write was performed.
- No Firecrawl scrape/crawl/extract/map job was executed.
- No public local service exposure was added.
- No fake Firecrawl connected status was set.

Exact Next Step

Keep Firecrawl at ****35% BLOCKED**** with `firecrawl\_credential\_required` until an owner-approved credential sync path and backend adapter are both present. Then rerun exactly one read-only public-page smoke and update Gateway / Agent Hub only if that live smoke passes.
