

Day 08 Phase 1 â OpenClaw+ Doctor Repair

Objective

Improve OpenClaw+ doctor reachability in Mission Control runtime without weakening security, changing '.env', or performing destructive host actions.

Actions Performed

1. Implemented resilient OpenClaw+ CLI resolution in runtime command execution:
 - Added fallback binary probe order for OpenClaw+ doctor/runtime commands.
 - Added non-destructive fallback sequence:
 - configured 'OPENCLAW_BIN'
 - 'CLAWDBOT_BIN' (if set)
 - 'OPENCLAW_FALLBACK_BIN' (if set)
 - 'openclaw'
 - 'clawdbot'
 - 'claudeclaw'
2. Preserved existing state-dir safety behavior:
 - Continued enforcing 'OPENCLAW_STATE_DIR' during command execution.
3. Kept auth model unchanged:
 - No role/auth gate changes.
 - No auth weakening.

Files Changed

- 'src/lib/command.ts'

Commands / Routes Used

- 'pnpm run typecheck'
- 'pnpm test'
- 'pnpm run build'
- 'git diff --check'
- Runtime binary probe:
 - 'command -v openclaw'
 - 'command -v clawdbot'

Test Results

- Typecheck: PASS
- Tests: PASS ('138' files / '1247' tests)
- Build: PASS
- Diff check: PASS

Production Proof / Outcome

- Mission Control now attempts multiple OpenClaw+ binary names before returning runtime-not-reachable.
- This reduces false negatives caused by host binary naming differences.
- In the current host runtime, no OpenClaw+ binary is available in PATH, so live doctor execution remains blocked.

Current Blockers

- 'openclaw_doctor_runtime_not_reachable'
 - Reason: No reachable OpenClaw+ CLI binary found on host runtime PATH.

Owner/Admin Action Package

1. Install or expose one approved OpenClaw+ CLI binary on the runtime host:
 - preferred: 'openclaw'
 - supported fallback aliases: 'clawdbot' or 'claudeclaw'
2. Ensure runtime service PATH includes the installed binary directory.
3. Re-run:
 - 'GET /api/openclaw/doctor' (authenticated admin)
 - 'POST /api/openclaw/doctor' (authenticated admin, fix pass)

Rollback

- 'git revert <commit_sha_for_this_phase>'

No-Secrets / Safety Confirmation

- No secrets printed.
- No auth files printed.
- No token values printed.
- No '.env' changes.
- No auth weakening.
- No public local service exposure added.

Updated Percentage (Scoped)

- OpenClaw+ (doctor reachability lane): increased in implementation-readiness reliability only.
- OpenClaw+ does ****not**** move to GO until authenticated live doctor execution succeeds.

Exact Next Step

Proceed to Day 08 Phase 2 (OpenClaw+ runtime service proof) and, in parallel, execute non-owner-dependent connector/runtime proofs while preserving existing owner-gated blockers.
