

Phase 2 — Firecrawl Credential and Read-Only Adapter Proof

Generated: 2026-05-07T22:33:22Z

Result

Status: BLOCKED / NOT CONNECTED

Exact blocker: `firecrawl\_credential\_required`

Mission Control does not currently have a Firecrawl credential in the running process or Mission Control env source, and the Firecrawl SDK is not installed in the Mission Control repo. A read-only Firecrawl smoke was not executed because the required credential and backend are not present in Mission Control. No secret values were read into the report, printed, copied, or committed.

Production Route Proof

Check	Result
Authenticated `GET /api/firecrawl/status`	HTTP 200
Firecrawl status	`credential_required`
Firecrawl state	`CREDENTIAL_REQUIRED`
Mission Control process has Firecrawl key	no
Mission Control env source has Firecrawl key	no
Firecrawl SDK loaded in Mission Control	no
ClaudeClaw env has Firecrawl key name	yes, value not inspected or printed
OpenClaw+ env has Firecrawl key name	yes, value not inspected or printed
Credential mismatch visible	yes
Approved fix required	yes
Unauthenticated `GET /api/firecrawl/status`	HTTP 401

Gateway / Agent Hub Truth

Card	Status	UI color	Truth
Playwright MCP	`connected_local_only`	green	Local-only read-only browser automation is proven.
Firecrawl	`blocked`	red	`firecrawl_credential_required`
YouTube Research	`limited_pending`	yellow	`youtube_transcript_connector_not_proven`

SpaceAgent Research Packet Check

Request tested through `POST /api/gateway/space-agent/research`:

```
`Use Firecrawl to scrape https://example.com and return a research packet only.`
```

Result:

```
| Field | Value |
| --- | --- |
| HTTP status | 200 |
| Mode | `space_agent_research_packet_planning` |
| Research performed | no |
| Execution enabled | no |
| Writes enabled | no |
| Operation | `firecrawl_scrape` |
| Firecrawl status in packet | `blocked_missing_credential` |
| Blocked reason |
`firecrawl_missing_credential_research_packet_can_still_use_browser_or_web_fallback_if_available` |
| No secrets exposed | yes |
| Raw paths exposed | no |
```

This confirms Gateway can classify and prepare a Firecrawl-oriented Research Packet, but it correctly does not claim live Firecrawl access.

Security / Governance Confirmation

- No Firecrawl key value was printed.
- No token, API key, auth file, or `.env` value was printed.
- No `.env` file was modified.
- No external write was performed.
- No Firecrawl scrape/crawl/extract job was executed.
- No Zapier, HeyGen, SMB, Farmer, upload, email, or connector write was executed.
- Firecrawl remains blocked until a credential and backend install path are approved.

Required Owner/Admin Action

1. Approve a secure credential sync path from the existing approved Firecrawl secret source into Mission Control, or configure a Mission Control-specific Firecrawl credential through the protected secret store.
2. Approve installing/wiring the Firecrawl SDK/runtime backend in Mission Control.
3. Restart Mission Control after the secret/backend are configured.
4. Re-run a read-only public-page smoke and update Gateway / Agent Hub from red blocked to connected/read-only only if the live call passes.

Updated Percentages

```
| System | Previous | Current | Notes |
| --- | ---: | ---: | --- |
```

| Firecrawl | 25% | 25% | No credential/backend in Mission Control, still blocked. |
| SpaceAgent Browser Automation | 66% | 66% | Playwright MCP remains proven; Firecrawl remains blocked.
|
| Gateway / Agent Hub | 72% | 72% | Status is truthful; visual owner proof remains blocked by owner
browser session. |

Phase 2 Decision

Firecrawl stays **BLOCKED** with `firecrawl\_credential\_required`. No fake live status was set and no unsafe credential movement occurred.
