

Phase 3 - Hermes Live Adapter Report

Generated: 2026-05-07T20:58:20-04:00

Result

****PARTIAL / BLOCKED****

Hermes service is active and Mission Control has protected Hermes routes, but a safe production live-chat adapter is still not configured. The correct blocker remains:

``hermes_safe_live_chat_adapter_not_configured``

Mission Control must not return ``hermes_called:true`` until a real no-tool, no-write Hermes call path is proven.

Production Service Evidence

Check	Result
hermes-gateway.service	active
MainPID	1796446
ActiveEnterTimestamp	Thu 2026-05-07 15:59:46 EDT
Local API listener discovered	none proven for Hermes live chat
Gateway process mode	messaging/gateway polling service
Public Hermes UI exposure	not proven / not exposed by this phase

Mission Control Route Evidence

Route	Unauthenticated Result	Meaning
GET /api/bridge/hermes/status	401	protected
GET /api/bridge/hermes/test-chat	401	protected
POST /api/bridge/hermes/test-chat	401	protected

Authenticated route proof is still blocked by missing owner/operator session material in this worker context. No auth bypass was attempted.

Adapter Safety Review

The Hermes CLI/runtime was inspected for a possible adapter path.

Findings:

- Hermes CLI has a one-shot mode, but it explicitly bypasses approval behavior and can load tools, so it is not safe for Mission Control live adapter use.
- Hermes chat/runtime can be configured with no toolsets, but the runtime still initializes agent session/log machinery

- and is not a proven no-write adapter.
- The agent runtime creates a session-log directory and has session persistence code paths. That violates the current no-write requirement for the live adapter.
 - No local Hermes HTTP chat API was discovered.

Therefore Mission Control should continue returning the safe 503 blocker for authenticated POST until a dedicated safe adapter exists.

Tests

Test	Result
src/lib/hermes-bridge.test.ts	20 passed
src/lib/gateway-security-proof.test.ts	4 passed
Combined focused tests	24 passed

Security Confirmation

- No secrets printed.
- No auth files printed.
- No `.env`` changes.
- No external writes.
- No Zapier / HeyGen / SMB / farmer execution.
- No shell, Docker socket, or direct secret access granted to Hermes.
- No fake ``hermes_called:true`` claim.

Status Update

System	Previous	Updated
Hermes	42% NO-GO live	42% NO-GO live

Hermes remains visible as lieutenant / skill-workflow specialist, but live Hermes chat is not proven.

Exact Next Step

Build a dedicated Hermes adapter that:

1. Accepts redacted Mission Control read-only context.
2. Uses a no-tool/no-write call path.
3. Does not create session logs or files.
4. Does not expose local UI publicly.
5. Returns a real response before setting ``hermes_called:true``.

Rollback

This phase changed only reports. Rollback command after commit:

```
`git revert <phase-3-commit>`
```
