

Fork 1 â Build-Wiki Run Now Approval Flow (Scoped)

Date: 2026-05-09

Status: IMPLEMENTED (scoped), pending owner approval for live dispatch proof

Scope Executed

- Wired only the ****Run Now**** approval flow for Build-Wiki / Farmer Sync.
- Kept strict scope to:
 - 'action = buildwiki.run_now'
 - 'target_service = opencloud-docs-farmer.service'
- Did ****not**** wire pause/resume/add source/external farmer/SMB or other connectors in this hop.

Files Changed

1. '/Users/sosastrike/Documents/to-knowledge-mission-control-2026/src/components/agent-network/AgentNetworkClient.tsx'
2. '/Users/sosastrike/Documents/to-knowledge-mission-control-2026/src/app/api/bridge/brain-sync/build-wiki/run-now/route.test.ts'

Endpoint Added

- No new endpoint was added in this hop.
- Reused existing scoped route:
 - 'POST /api/bridge/brain-sync/build-wiki/run-now'
- Existing dispatch route remains the execution surface:
 - 'POST /api/bridge/brain-sync/build-wiki/run-now/[id]/dispatch'

UI Behavior (Updated)

- Build-Wiki Run Now card now shows explicit progress state:
 - 'Request run' â 'Approval pending' â 'Run dispatched / completed'
- State labels now reflect backend 'ui_state' truthfully:
 - 'pending_approval', 'approved/dispatching', 'completed', 'failed', 'denied', 'expired'
- No fake completion states were introduced.

Approval Request Behavior

- 'POST /api/bridge/brain-sync/build-wiki/run-now':
 - Requires active Bridge Session with 'buildwiki.run_now' scope.
 - Creates owner-channel approval request.
 - Does ****not**** execute immediately.
 - Returns 'ui_state: pending_approval' and execution remains disabled.

Audit Behavior

- Existing dispatch route preserves audit-path contract:
 - Dispatch writes 'bridge_connector_runs' and 'bridge_audit_events'.
 - Target service remains hard-guarded to 'opencloud-docs-farmer.service'.

Verification Results

1. 'pnpm run typecheck' â
2. 'pnpm run build' â
3. 'pnpm run test' â (138 files / 1252 tests)
4. Targeted Run Now route tests â
 - blocked without scoped Bridge Session
 - success creates scoped owner approval request and keeps execution disabled
5. 'git diff --check' â
6. 'node scripts/check-protected-file-invariants.mjs' â
7. Route smoke script launched with local server:
 - Auth-gated routes rendered correctly for unauthenticated access (307/401 expected)
 - API-key-protected checks were blocked locally with 401 in this environment

Service/Timer Verification

- Local workstation runtime does not provide 'systemctl' ('command not found'), so direct local verification of:
 - 'opencloud-docs-farmer.service'
 - 'opencloud-docs-farmer.timer'
- is blocked in this environment.

- Live dispatch and service/timer verification must run on the Linux runtime host where systemd is present.

Secrets / Safety

- No '.env' change.
- No secret/token output.
- No auth weakening.
- No connector broadening.

Commit / Push

- Pending at time of report writing; will be appended after commit/push.

Rollback Command

- Will be recorded as:
 - 'git revert <commit_sha>'
