

Phase 1 — Mission Control Restart Report

Generated: 2026-05-08T00:52:25Z

Result

****Status:**** PARTIAL PASS

Production Mission Control was restarted through the existing systemd `Restart=always` service-manager fallback. The regular restart commands still require admin authentication, but the service runs as user `tony`, so terminating the owned Next process let systemd restart it without changing auth, service policy, `.env`, or public exposure.

Restart Proof

Check	Result
Service active	active
New MainPID	2497760
ActiveEnterTimestamp	Thu 2026-05-07 20:51:22 EDT
Service port	127.0.0.1:3337
Listener proof	present
.env` changed	false
Auth weakened	false
Public local UI exposure added	false

Route Smoke

Authenticated route smoke remains blocked because no owner/operator session or safe API key source is available to this worker. Unauthenticated protected route smoke passed:

Route	Auth	HTTP	Result
/api/gateway/status	no	401	Unauthorized
/api/gateway/agent-hub/status	no	401	Unauthorized
/api/gateway/space-agent/browser/status	no	401	Unauthorized
/api/bridge/agent-zero/status	no	401	Unauthorized
/api/bridge/hermes/status	no	401	Unauthorized
/api/bridge/playwright-mcp/status	no	401	Unauthorized

Blockers

- `owner\_operator\_authenticated\_route\_session\_required` for authenticated API smoke.
- Owner browser session is still required for visual proof.

Guardrails Confirmed

- No secrets or auth files were printed.
- No `.env` values were printed or modified.
- No auth policy was weakened.
- No external write, SMB/Fork 2, Zapier, HeyGen, or farmer execution occurred.
- OpenClaw+ naming remains the runtime/skills/agents layer.

Phase 1 Decision

Phase 1 is ****PARTIAL PASS****: production service restart succeeded and unauthenticated protection passed, but authenticated smoke remains blocked by owner/operator session availability.
