

Phase 004 - Hermes Safe Live Adapter Gate

Generated: 2026-05-07T16:53:18-04:00

Result

Phase 004 status: ****BLOCKED / FAIL** for live Hermes GO.**

Mission Control still returns the safe blocker `hermes\_safe\_live\_chat\_adapter\_not\_configured`. I did not build a live adapter because the discovered Hermes direct call path is not safe enough for this gate.

Production Route Proof

```
| Route | HTTP | Result |
| --- | --- | --- |
| `GET /api/bridge/hermes/status` | 200 | Hermes status route healthy/reachable. |
| `POST /api/bridge/hermes/test-chat` | 503 | `hermes_called:false`; exact blocker `hermes_safe_live_chat_adapter_not_configured` |
| Unauthenticated Hermes routes | 401 | Protected. |
```

Hermes Runtime Audit

```
| Item | Current truth |
| --- | --- |
| User service | active |
| Gateway role | Messaging platform gateway, not a proven read-only Mission Control chat API |
| Direct local HTTP chat endpoint | Not found in this gate |
| Hermes CLI | Installed |
| One-shot CLI safety | Not acceptable for Mission Control live adapter because help text states tools, memory, rules, and work |
| Public exposure | No new public exposure added |
```

Why I Did Not Wire the Adapter

The dossier requires a safe read-only adapter with no tool execution, no writes, no provider one-shot execution, no secrets, and execution disabled. The Hermes CLI one-shot mode is explicitly designed for scripts but is not safe for this gate because it can load tools/memory/rules and auto-bypass approvals. Wiring that would violate the owner rule against unsafe one-shot provider calls and could create fake live confidence.

Security Confirmation

- No Hermes tool execution occurred.
- No writes occurred.
- No external writes occurred.
- No Zapier write, HeyGen generation, SMB mount, or farmer action occurred.
- No `.env` file was changed.
- No secrets were printed in this report.
- Hermes remains behind authenticated Mission Control routes.

Required Fix Path

Build or expose one of these safe adapter paths before Hermes can move to GO:

1. a Hermes local API endpoint that accepts a prompt plus redacted Mission Control context and guarantees no tools/no writes/no memory mutation;
2. an ACP/MCP-style Hermes endpoint configured in read-only/no-tool mode with audited policy enforcement;
3. a dedicated Mission Control wrapper in Hermes that uses a no-tool provider mode and rejects any tool plan before execution.

Until one of those is proven, Hermes stays PARTIAL/NO-GO live with the blocker `hermes\_safe\_live\_chat\_adapter\_not\_configured`.

Next Step

Proceed only with safe read-only/report work or implement a dedicated no-tool Hermes adapter in a separate code phase. Do not use the generic Hermes one-shot CLI as the production live adapter.

Rollback

This phase adds report artifacts only. Rollback command after commit: ``git revert <phase-004-commit>``.
