

Phase 10 - OpenClaw+ Health Repair Report

Generated: 2026-05-07T21:07:57-04:00

Result

****PARTIAL GO / RUNTIME HEALTHY, AUTHENTICATED DOCTOR PROOF PENDING****

OpenClaw+ / ClaudeClaw service health is better than the stale blocker indicated. The user service is active, runtime ports are protected/local, and the project status command reports all systems go. No destructive repair was needed or performed.

Service and Runtime Checks

Check	Result
claudeclaw.service	active
MainPID	1287
ActiveEnterTimestamp	Wed 2026-05-06 22:37:41 EDT
Local app port	protected, 401 without auth
Local gateway UI port	200
Local gateway protected port	401 without auth
Global openclaw CLI alias	not present
Global claudeclaw CLI alias	not present
Project npm run status	all systems go

The status command output was redacted before capture. No credential values were printed.

Mission Control Route Protection

Unauthenticated route checks after Mission Control restart:

Route	Result	Meaning
GET /api/openclaw/doctor	401	protected
GET /api/bridge/openclaw/status	401	protected
GET /api/gateway/nodes/openclaw-plus	401	protected

Authenticated doctor proof remains blocked by missing owner/operator session material in this worker context.

Dirty Tree Note

The OpenClaw+ worktree contains many pre-existing parked/deleted runtime report artifacts and untracked runtime/debug files. They were not modified, deleted, staged, or committed in this phase.

Repairs Performed

No code, memory, skill, agent, report, governance, runtime data, or credential repair was performed because no concrete runtime fault was confirmed by the safe status checks.

Security Confirmation

- No secrets printed.
- No auth files printed.
- No ``.env`` changes.
- No agents, skills, memory, reports, governance, or runtime data deleted.
- No service policy weakened.
- No external writes or farmer execution.

Updated Percentage

System	Previous	Updated
OpenClaw+	62% PARTIAL / stale unhealthy doctor state	72% PARTIAL GO

OpenClaw+ remains PARTIAL because authenticated Mission Control doctor proof and global CLI alias hygiene are still unresolved.

Exact Remaining Blockers

- ``owner_authenticated_openclaw_doctor_required``
- ``openclaw_cli_alias_not_on_plain_shell_path``
- ``claudeclaw_cli_alias_not_on_plain_shell_path``
- ``parked_runtime_artifacts_need_separate_cleanup_phase``

Exact Next Step

Run authenticated Mission Control doctor proof from owner/operator session, then cleanly add CLI aliases only if the owner wants plain-shell commands. Parked artifact cleanup must remain isolated from runtime health repair.

Rollback

This phase changed only reports. Rollback command after commit:

```
`git revert <phase-10-commit>`
```
