

Pi Dispatcher Final Readiness Report

Generated: 2026-05-07 21:38:52

Final Decision

****PARTIAL GO / SHADOW.**** Pi is now properly represented and tested as a Mission Control Gateway shadow dispatcher / route optimizer candidate. It is not a standalone proven runtime, so it cannot be marked GO.

Readiness

Area	Status
Runtime installed/reachable	not proven
In-process shadow dispatcher	proven
Gateway node	proven as `pi`; canonical role `pi\_dispatcher`
Bridge status route	added: `/api/bridge/pi/status`
Agent Hub panel model	proven by tests
Route matrix recommendations	proven by tests
Execution	disabled
Writes	disabled
Public exposure	none
Secrets	none exposed
Owner-auth visual proof	blocked by missing owner browser session

Percentage

Pi moves from ****68% PARTIAL GO / shadow**** to ****72% PARTIAL GO / shadow****.

It does not move to GO because `pi\_runtime\_session\_not\_proven` remains true.

Exact Blockers

- `pi\_runtime\_session\_not\_proven`
- `owner\_authenticated\_browser\_session\_required`

Tests Passed

- `src/lib/gateway-pi-dispatcher.test.ts`: 9 passed

- `src/lib/gateway-agent-hub.test.ts`: 3 passed
- `src/lib/gateway-route-auth.test.ts`: 1 passed
- `pnpm run typecheck`: passed
- `pnpm run build`: passed and includes `/api/bridge/pi/status`

Security Confirmation

No secrets, auth files, token values, passwords, or `.env` values were printed or committed. No `.env` files were modified. Pi received no write tools, execution tools, external connector tools, root shell, Docker socket, SMB, Zapier, HeyGen, delivery, or farmer execution authority.

Rollback

git revert

Next Step

To move Pi to GO, install or prove a real local-only Pi runtime/session, connect it behind authenticated Mission Control/Gateway routes, keep execution/writes disabled, run the same route matrix against the real runtime, and capture owner-authenticated Agent Hub visual proof.
