

SpaceAgent Firecrawl Production Proof Report

SpaceAgent Firecrawl Production Proof Report

Generated: 2026-05-07T21:54:13.799Z

Executive Result

Firecrawl production proof is truthful-blocked, not live. Mission Control exposes protected read-only Firecrawl status and Gateway can classify Firecrawl requests for SpaceAgent, but the Firecrawl live adapter is not production-ready because Mission Control has no Firecrawl credential loaded and the Firecrawl SDK is not loaded.

Completion

- Proof phase completion: 100% for truthful validation.
- Firecrawl integration completion: 35%.
- Release decision: NO-GO for live Firecrawl adapter; PASS for blocked-state honesty.

Production Route Evidence

- Authenticated GET /api/firecrawl/status: 200.
- Unauthenticated GET /api/firecrawl/status: 401.
- Authenticated GET /api/firecrawl/jobs: 200 with no jobs table yet.
- Gateway SpaceAgent browser status card: blocked, red.
- Blocker shown in Gateway: firecrawlcredentialrequired.
- SpaceAgent research packet for Firecrawl scrape: returns a Research Packet plan with firecrawlstatus=blockedmissingcredential, routeddecision=missingcredential, executionenabled=false, writesenabled=false.

Current Truth

- Mission Control process has Firecrawl key: false.
- Mission Control env has Firecrawl key by name: false.
- OpenClaw+/ClaudeClaw show Firecrawl credential presence by name: true.
- Mission Control Firecrawl SDK loaded: false.
- Backend mismatch visible: true.
- Approved fix required: true.

What Passed

- Protected route auth works.
- No secret value was printed.
- No Firecrawl job was executed.
- No external write occurred.
- SpaceAgent/Gateway did not fake live access.
- UI state is correct: Firecrawl remains red/blocked.

What Failed Or Remains Blocked

- Firecrawl credential is not available inside the Mission Control runtime.
- Firecrawl SDK/job runner is not wired in Mission Control.
- No Firecrawl live search/scrape/crawl/map/extract call was proven.
- No persistence table exists for Firecrawl jobs.

Requirements From Owner/Admin

- Approve a secure credential sync path into Mission Control runtime without printing or pasting the secret.
- Approve installation/wiring of the Firecrawl SDK and read-only runner.
- Approve job persistence schema before enabling any queued crawl workflow.

Safety Confirmation

No secrets exposed. No .env modification. No external writes. No Zapier/HeyGen. No SMB/Fork 2. No farmer execution. No fake Done.
