

Phase 8 — Paperclip Codex and Claude Auth Separation

Generated: 2026-05-07T22:47:40Z

Result

Status: PARTIAL / BLOCKED FOR PAPERCLIP SMOKE

Exact blocker: `paperclip\_auth\_required\_or\_not\_configured`

Codex/ChatGPT and Claude/Anthropic are treated as separate auth surfaces. I did not reuse Codex auth for Claude, did not print auth files, did not print tokens, and did not enable Anthropic API billing.

Codex / ChatGPT Check

Check	Result
---	---
Codex CLI installed on production host PATH	no
Codex local auth config presence	yes, value/content not inspected
Paperclip adapter references for Codex/Claude family	yes
Safe no-write Codex smoke through Paperclip	blocked
Blocker	`paperclip_auth_required_or_not_configured`
Auth mode target	ChatGPT/local Codex auth, not inline API key

Claude / Anthropic Check

Check	Result
---	---
Claude CLI installed on production host PATH	no
Claude local auth config presence	yes, value/content not inspected
Required auth method	`claude_code_oauth`
`ANTHROPIC_API_KEY` present	no
Anthropic API billing enabled	no
Safe no-write Claude smoke through Paperclip	blocked
Blocker	`paperclip_auth_required_or_not_configured`

Separation Decision

Rule	Result
---	---
Codex keeps Codex auth only	yes
Claude uses separate Claude Code OAuth path	required / not proven live
Codex auth reused for Claude	no

Anthropic API key billing used	no
Tokens printed	no
Auth files printed	no
`.env` modified	no

Security / Governance Confirmation

- No token, API key, auth file, password, or `.env` value was printed.
- No `.env` file was modified.
- No provider API billing mode was enabled.
- No Paperclip task/write action was executed.
- No external writes occurred.
- No Zapier, HeyGen, SMB, Farmer, email, upload, or connector write occurred.

Required Action

1. Install or expose approved Codex CLI to the Paperclip sandbox if Paperclip should use local Codex.
2. Install or expose approved Claude Code CLI to the Paperclip sandbox if Paperclip should use Claude Code OAuth.
3. Complete Paperclip owner login/session bridge first, because Paperclip adapter smoke is blocked until Paperclip auth is configured.
4. Keep Anthropic API billing disabled unless the owner explicitly approves API-key billing.
5. Re-run safe no-write Codex and Claude smoke through Paperclip after auth/session wiring.

Updated Percentages

System	Previous	Current	Notes
Paperclip Codex auth	25%	30%	Auth config presence exists, but CLI/smoke not available through Paperclip.
Paperclip Claude auth	20%	30%	Auth config presence exists and API billing off, but CLI/smoke not available through Paperclip.
Paperclip auth separation	55%	65%	Separation policy is clear; live adapter proof blocked by Paperclip auth/session.

Phase 8 Decision

Paperclip Codex/Claude auth separation is ****policy-correct but not live-proven****. The safe smoke remains blocked by `paperclip\_auth\_required\_or\_not\_configured` and missing production-host CLI availability.
