

Day 08 Phase 2 â OpenClaw+ Runtime Service Proof

Objective

Prove whether OpenClaw+ runtime/CLI is actually installed and reachable from Mission Control runtime context, without weakening auth and without '.env' changes.

Scope and Safety

- No secrets printed.
- No auth files printed.
- No token values printed.
- No '.env' changes.
- No auth weakening.
- No destructive runtime repair.

Actions Executed

1. Verified local branch lineage includes Day 05/06/07 commits and latest workstream head.
2. Checked runtime binary availability in current host context:
 - 'command -v openclaw'
 - 'command -v clawdbot'
 - 'command -v claudeclaw'
3. Searched approved runtime locations and common host locations for binaries.
4. Inspected LaunchAgent and runtime scripts for references to OpenClaw+ binary/runtime paths.
5. Started authenticated Mission Control runtime context on '127.0.0.1:3337' (local-only) with D B-aligned API key for route proof.
6. Ran authenticated OpenClaw+ doctor routes:
 - 'GET /api/openclaw/doctor'
 - 'POST /api/openclaw/doctor'

Runtime Service Context Proof

- Service user (local runtime process): 'sosastrike'.
- Runtime binding: '127.0.0.1:3337' (no public exposure added).
- Runtime PATH (launcher context): verified and captured during execution context; no OpenClaw+ CLI binary resolved.
- Binary discovery result:
 - 'openclaw': not found
 - 'clawdbot': not found
 - 'claudeclaw': not found
- No executable OpenClaw+ CLI found in scanned host paths.

Authenticated Route Results

1. 'GET /api/openclaw/doctor' -> '400'
 - Response: '{"error":"OpenClaw is not installed or not reachable"}'
2. 'POST /api/openclaw/doctor' -> '400'
 - Response: '{"error":"OpenClaw is not installed or not reachable"}'

Outcome

OpenClaw+ doctor execution is authenticated and route-reachable, but CLI execution remains blocked because no reachable OpenClaw+ binary exists in host runtime context.

Blocker

- 'openclaw_doctor_runtime_not_reachable'
- Reason: no executable OpenClaw+ binary currently installed/reachable in runtime PATH (or configured fallback absolute paths).

Owner/Admin Install Action Package

1. Install one approved CLI binary on the runtime host:
 - preferred: 'openclaw'
 - fallback accepted by runtime: 'clawdbot' or 'claudeclaw'
2. Ensure runtime service user can execute it.
3. Ensure runtime service PATH includes binary directory (or set approved absolute path via 'OPENCLAW_BIN'/fallback env in service manager).
4. Restart Mission Control runtime.

5. Re-run authenticated checks:
- 'GET /api/openclaw/doctor'
 - 'POST /api/openclaw/doctor' (safe fix path)

Parallel Non-Blocking Continuation Snapshot

Captured authenticated status snapshot in:

- 'runtime/day-08-parallel-snapshot.json'

Key statuses:

- Bridge session: '200'
- Bridge execute probe: '423' (approval/session gate still enforced)
- Paperclip status: '200'; companies/agents/issues: '503'
- Telegram status: '200'; upload probe: '423'
- Google Drive status: '200'
- OneDrive status: '200'
- YouTube status: '200'; research probe: '200' (limited path still subject to transcript blocker policy)
- Firecrawl status: '200'; search probe: '404' (backend path not live)

Files Changed

- 'runtime/day-08-phase-2-openclaw-runtime-service-proof.md'
- 'runtime/day-08-phase-2-openclaw-runtime-service-proof.pdf'
- 'runtime/day-08-parallel-snapshot.json' (evidence artifact)

Tests / Validation

- Authenticated route proofs executed live in local runtime context.
- No destructive actions executed.
- No '.env' changes detected.

Commits

- No code-path changes were required for this phase proof.
- Evidence/report artifacts pending commit in next validation batch.

Rollback

- If only report artifacts are committed, rollback is:
 - 'git revert <report_commit_sha>'

No-Secrets Confirmation

- Confirmed: no secrets, tokens, or auth file contents were printed in report artifacts.

Updated Percentage Guidance

- OpenClaw+ lane: readiness proof improved (authenticated route + exact blocker proof).
- OpenClaw+ cannot be marked GO until CLI installation/path blocker is cleared and doctor execution returns real health payload.

Exact Next Step

Do not run Day 08 Phase 3 remediation yet (requires successful doctor execution payload).

Proceed with parallel main tracks:

1. Bridge approved execution proof.
2. Paperclip owner/session recovery package.
3. Telegram scoped live attachment proof (if Bridge approval exists).
4. Drive/OneDrive upload adapter proof.
5. AgentMail connector proof.
6. YouTube transcript proof improvement.
7. Firecrawl remains parallel-blocked by credential/backend.
