Day 04 Phase 9 â Firecrawl Parallel Prep

Objective

Advance Firecrawl readiness in parallel without blocking main implementation lane and without exposing credentials.

Actions Executed

1. Checked Firecrawl credential presence by name only (no value output).
2. Verified backend route presence in Mission Control:
 - 'src/app/api/firecrawl/[[...path]]/route.ts' exists.
3. Checked dependency inventory for explicit Firecrawl SDK package.
4. Preserved no-write/no-.env policy.

Commands Used

- env presence check script ('yes/no' only)
- file existence check for backend route
- dependency presence check in 'package.json'

Proof

- 'firecrawl_credential_present': 'no'
- 'firecrawl_backend_route_present': 'yes'
- 'firecrawl_sdk_dependency_present': 'no'

Current Blockers

- 'firecrawl_credential_required'
- 'firecrawl_backend_adapter_not_configured'

Safety Confirmation

- No credential values printed.
- No auth file contents printed.
- No '.env' changes.
- No crawl/write/login/private-page execution attempted.

Files Changed

- Report artifact only for this phase.

Commits

- Pending Day 04 commit batch.

Rollback

- No runtime mutation performed in this phase.

No-Secrets Confirmation

- Confirmed.

Updated Percentage

- Firecrawl remains BLOCKED at current level until credential + backend adapter + one live read-only smoke pass.

Exact Next Step

- As soon as approved credential source is connected, run exactly one read-only smoke on 'https://example.com/' and return ResearchPacket through SpaceAgent.
