

Gateway FULL v3 Visibility â Production Commit Verification

Goal

Confirm that the Gateway FULL v3 routing fix ('8972a3d') is in the deployed production lineage and that runtime safety constraints remain intact.

Result

PASS (commit lineage verified; production route behavior consistent with deployed protected Gateway surface).

Actions

1. Verified active working branch:
 - 'to-knowledge-mc'
2. Verified remote branch contains required fix commit:
 - 'git merge-base --is-ancestor 8972a3d origin/to-knowledge-mc' => 'origin_contains_8972a3d=yes'
3. Verified remote HEAD:
 - 'origin/to-knowledge-mc' => 'be268e1'
4. Verified production runtime reachability:
 - 'GET https://tkmc.knowledge-vs-ai.com/login' => '200'
5. Verified designer Gateway entry route remains protected:
 - 'GET /designer-mission-control/design/gateway/index.html' => '307 /login'
6. Verified no '.env' diff in repo.
7. Confirmed no secret values were printed during verification commands.
8. Confirmed no new public local service exposure was introduced by this phase.

Production Runtime HEAD Assessment

- Direct remote process git HEAD is not externally exposed by production.
- Operational proof used:
 - required commit is present in deployment branch lineage ('origin/to-knowledge-mc');
 - production Gateway surface remains deployed/protected and reachable;
 - alias behavior is validated in Phase 2 + route contract test pass.

Safety Confirmation

- '.env' changes: none
- Secret output: none
- Auth weakening: none
- Public local exposure added: none

Blockers

None for this verification phase.

Next Step

Run full Gateway route/alias smoke and owner-auth visual proof gate (owner confirmation required for GO).
