# Gateway FULL v3 Visibility â Route and Alias Smoke

## Goal

Verify Gateway FULL v3 routes and legacy aliases resolve safely under production protection behavior, and confirm alias contract coverage for authenticated flow.

## Result

PASS (protection behavior confirmed on production; alias contract verified by test).

## Unauthenticated Production Smoke

Base: 'https://tkmc.knowledge-vs-ai.com'

Evidence file:

- 'runtime/gateway-v3-visibility-route-alias-smoke.json'

Checked routes:

- '/gateway'
- '/gateway/routes'
- '/gateway/registry'
- '/gateway/policies'
- '/gateway/health'
- '/gateway/dispatcher'
- '/gateway/token-governor'
- '/gateway/agent-hub'
- '/agent-network'
- '/agents'
- '/gateway-parent'
- '/gateways'
- '/gateway-config'

Observed behavior:

- All routes returned '307' to '/login' for unauthenticated access.
- This matches expected protected-page policy (no public unauthenticated access).

## Alias Mapping Contract (Authenticated/Route-Logic Proof)

Because auth middleware redirects unauthenticated traffic before panel redirect logic runs, alias destination verification was proven via route contract tests:

- 'pnpm vitest run src/app/gateway-route-alias.test.ts'
- Result: '6 passed'

Covered expectations:

- 'gateway-parent' -> '/gateway/agent-hub'
- 'gateways' -> '/gateway'
- 'gateway-config' -> '/gateway/policies'
- '/agent-network' and '/agents' compatibility alias -> '/gateway/agent-hub'

Route implementation source confirms same mapping in 'src/app/[...panel]/route.ts'.

## Safety Confirmation

- No '.env' changes
- No secret output
- No auth weakening
- No fake live claim

## Blockers

None for route-protection and alias-contract smoke.

## Next Step

Owner-authenticated visual confirmation of the Gateway FULL v3 interface remains required before marking owner visual proof GO.
