Day 23 â Approval Request Model 100% Closure

Date: 2026-05-09

Status: CLOSED developer-side / NONE

Lane

Bridge Approval Request Model.

What Was Implemented

Implemented a complete modeled approval request contract for the Bridge queue.

The model now exposes:

- request type
- parsed approval scope
- connector/action/target metadata
- requester and required owner approver
- lifecycle timestamps for requested, approved, denied, expired, and resolved states
- execution/run summary from 'bridge_connector_runs' when present
- result/error fields from audit metadata when present
- latest audit pointer
- rollback availability/reference

This is a model/readiness lane only. It does not enable broad execution, connector writes, or fake approval state.

Files Changed

- 'src/lib/bridge-approval-lifecycle.ts'
- 'src/lib/bridge-approval-lifecycle.test.ts'
- 'src/app/api/bridge/approval-requests/route.ts'

Routes Changed

- 'GET /api/bridge/approval-requests'
 - now returns:
 - 'approval_request_models'
 - 'active_approval_models'
 - 'history_approval_models'
- 'POST /api/bridge/approval-requests'
 - now returns 'approval_request_model' for the created/reused request.
 - still creates only a pending approval request.
 - still reports 'execution_enabled=false' and 'accepted_for_execution=false'.

No approve/deny route behavior was expanded into execution.

UI Behavior

No visual UI was changed in this lane.

The API now provides the complete request model that the Bridge UI can consume in Day 24.

Service / Runtime Behavior

Mission Control proof runtime was rebuilt and restarted locally on:

- Bind: '127.0.0.1:3337'
- New PID: '2125'

- '/login': 200

No public exposure was added.

Runtime Proof

Created one internal Day 23 proof approval request through:

- 'POST /api/bridge/approval-requests'

Then immediately denied it through:

- 'POST /api/bridge/approval-requests/{id}/deny'

Proof result:

- create status: 201
- deny status: 200
- approval model returned on create: yes
- proof model visible from queue: yes
- final proof model state: 'denied'
- execution enabled: false
- writes enabled: false
- accepted for execution: false
- audit pointer present: yes

A stale legacy readiness-smoke probe also created a pending internal probe during validation because that script still assumes creation must be blocked when its readiness flag says migration-not-applied. That probe was immediately denied. Final queue proof shows:

- model count: 2
- pending count: 0
- history denied count: 2

The stale script behavior is a follow-up for the approval-readiness surface, not a blocker for the Day 23 model contract.

Proof Artifacts

- 'runtime/day-23-approval-request-model-proof.json'
- 'runtime/day-23-approval-request-model-queue-proof.json'

Tests Run

- RED check:
 - 'pnpm test src/lib/bridge-approval-lifecycle.test.ts'
 - initial failure confirmed 'mapBridgeApprovalRequestModel' was missing.
- Focused green check:
 - 'pnpm test src/lib/bridge-approval-lifecycle.test.ts'
 - 1 file / 4 tests passed.
- Validation:
 - 'git diff --check': passed
 - 'pnpm run typecheck': passed
 - 'pnpm run build': passed
 - 'pnpm test': passed, 151 files / 1311 tests
 - 'node scripts/check-protected-file-invariants.mjs': passed
 - staged secret scan: passed
 - '.env' diff check: clean

Remaining Blocker

None for Day 23 developer-side closure.

Blocker classification: 'NONE'

Bridge approved execution remains a later lane and is not claimed here.

Rollback

Code rollback:

```
""bash
git revert 004c5d6
""
```

Commit / Push

Code commit:

- '004c5d6' â 'feat(bridge): expose complete approval request model'

Push result:

- pushed to 'origin/to-knowledge-mc'

Next Day Started

Day 24 â Bridge Approval UI starts automatically.
