

Gateway UI Pixel Fidelity Fix Report

Objective

Restore FULL v3 fidelity by preserving designer HTML as the rendered source and avoiding custom reinterpretation.

Actions

1. Verified Gateway routes remain mounted to designer files under:
 - 'public/designer-mission-control/design/gateway/*.html'
2. Kept 'shared/tokens.css' and shared class grammar untouched.
3. Limited code change to shell-level mounting behavior (scroll/navigation wrapper), not mock rendering internals.

Fidelity Rules Preserved

- Status grammar remains: 'green/yellow/blue/red/gray'.
- Shared tokens remain source of spacing/color/font.
- Designer page rendering remains HTML-first through mounted mock route surface.

Production Truth Guard

- No fake "live" promotion introduced.
- Existing blocked/gated states remain unchanged unless proven by live backend proof.

Blocker

- Owner side-by-side visual acceptance still required after deployment.

No-Secrets Confirmation

- No secrets exposed.
- No auth changes.
- No '.env' edits.

Next Step

Deploy and run owner side-by-side check at 1480px; treat any drift as defect until owner confirms.
