

OpenClaw+ Mini-Agent Execution Bridge Proof

Generated: 2026-05-07T22:16:43.960Z

Executive Result

OpenClaw+ mini-agent execution bridge is ****PARTIAL GO**** for proposal, policy, and Gateway visibility. Live mini-agent execution remains blocked until Bridge Session scope and a registered runtime adapter are enabled.

A production policy bug was found and fixed in this phase: unsafe requested capabilities such as raw shell were being filtered out before validation, allowing the proposal response to remain ok=true. The validator now rejects forbidden purpose text, forbidden scope text, and forbidden requested capabilities before proposal acceptance.

Production Route Evidence

Check	Result
Gateway mini-agent OS GET	200 authenticated
Gateway mini-agent OS unauthenticated	401
OpenClaw+ Gateway node	200, connected, execution requires Bridge Session
OpenClaw+ version route	200
OpenClaw+ doctor route	timed out in smoke window
Safe mini-agent proposal	200, ok=true, proposal_only
Unsafe mini-agent proposal	400, ok=false
Unsafe blocker	mini_agent_purpose_contains_forbidden_access
Execution enabled	false
Writes enabled	false

OpenClaw+ Role

OpenClaw+ is the runtime / skills / adapters / reports / governance / agent execution layer. Paperclip sits before OpenClaw+ as the Workforce Control Plane. Agent Zero remains commander. Hermes remains skill/workflow builder. Pi remains dispatcher candidate. Mini-agents remain subordinate workers and cannot self-promote.

Policy Fix Applied

Policy Area	Before	After
Forbidden capability validation	unsafe capability names could be filtered before validation	forbidden requested capabilities block the proposal
Forbidden purpose validation	not explicitly checked	forbidden purpose text blocks the proposal
Raw shell pattern	narrower text coverage	raw_shell, raw shell, and related variants block
Docker socket pattern	narrower text coverage	docker_socket and docker socket variants

block |
| External write pattern | narrower text coverage | external_write and external write variants
block |

Mini-Agent Execution Status

Capability	Status
Proposal creation	available for safe, scoped proposals
Supervisor requirement	enforced
Agent Zero command authority	preserved
Memory TTL	captured and bounded
Bridge Session requirement	enforced for activation
Runtime adapter execution	blocked until registered and scoped
Raw root shell	blocked
Docker socket	blocked
Direct secret reads	blocked
External writes	blocked without Bridge Session

Tests Passed

- Mission Control typecheck passed after the policy patch.
- Gateway mini-agent OS tests passed.
- Gateway mini-agent contract tests passed.
- Gateway mini-agent gauntlet passed.
- Mission Control production build passed.
- Mission Control production restart succeeded.
- Production safe proposal smoke passed.
- Production unsafe proposal smoke blocked correctly.

Remaining Blockers

Blocker	Impact	Exact Next Step
mini_agent_activation_requires_bridge_session_and_registered_runtime_adapter	Mini-agents cannot run live yet.	Add/verify a registered OpenClaw+ runtime adapter and require Bridge Session scope before activation.
OpenClaw+ doctor timeout	Full runtime health proof is incomplete.	Investigate doctor route latency and return a bounded degraded payload instead of timing out.
No live mini-agent execution proof	Cannot mark mini-agent execution GO.	Run one scoped read-only mini-agent through the approved runtime adapter after Bridge Session policy is proven.

Security Confirmation

- No mini-agent executed.
- No external write occurred.
- No raw shell, Docker socket, direct secret read, SMB/Fork 2, Zapier, HeyGen, or farmer

action occurred.

- No secrets were printed or committed.
- No .env changes were made.
- OpenClaw+ was retained as runtime layer and not replaced.

Completion Estimate

| Component | Percent | Status |

| --- | ---: | --- |

| Mini-agent proposal schema | 85% | working and policy-gated |

| Forbidden capability blocking | 90% | fixed and tested |

| Gateway/OpenClaw+ node visibility | 85% | connected, execution gated |

| Bridge Session activation enforcement | 80% | policy contract present |

| Live OpenClaw+ runtime execution | 0% | blocked until adapter/session proof |

| OpenClaw+ mini-agent bridge overall | 62% | PARTIAL GO |

Final Decision

OpenClaw+ mini-agent execution bridge: ****PARTIAL GO****.

Proposal and safety gates are production-visible and tested. Live execution remains correctly blocked.
