

## # Day 06 Phase 3 â Bridge Session Persistence and Approved Execution Proof

### ## Objective

Move Bridge Session from persistence-blocked state toward executable scoped approvals by fixing storage prerequisites and validating session lifecycle logic.

### ## Result

PARTIAL PASS.

Persistence schema gap was fixed in code and validated by tests. Live approved execution is still blocked pending owner approval/session activation in runtime.

### ## What Was Broken

Observed blocker chain in runtime:

- 'bridge\_session\_persistence\_not\_applied'
- 'active\_bridge\_session\_required'
- 'owner\_approval\_pending'

Root cause found:

- Runtime DB had 'bridge\_sessions' and 'bridge\_session\_audit\_events' tables,
- but was missing:
  - 'bridge\_approval\_requests'
  - 'bridge\_audit\_events'

Without those tables, Bridge Session read/create flows remained blocked.

### ## Implementation Completed

Added migration:

- '053\_bridge\_approval\_audit\_persistence' in 'src/lib/migrations.ts'

Migration creates:

1. 'bridge\_approval\_requests'
2. 'bridge\_audit\_events'
3. indexes for idempotency, state/history lookup, action/audit lookup, and correlation lookups.

This removes the schema-level persistence gap that produced 'bridge\_session\_persistence\_not\_applied' when migrations are applied on runtime startup.

### ## Tests Executed

1. 'pnpm run typecheck' -> PASS
2. 'pnpm test src/lib/agent-zero-bridge-session.test.ts src/lib/agent-zero-execution-gateway.test.ts src/lib/approval-queue-state.test.ts' -> PASS
  - 3 files
  - 24 tests
  - 0 failures

These tests cover:

- session created,
- pending approval reuse,
- approval -> active transition,
- execution/audit gating,
- blocked behavior without active session.

### ## Live Proof Status

Live scoped execution remains blocked in this phase because owner approval/session activation is not currently available in the active runtime session.

No fake execution was claimed.

### ## Owner Approval Action Package (Exact)

To complete live scoped execution proof:

1. Open Bridge Session in Mission Control.

2. Approve one exact-scope action.
3. Run one safe action only (preferred order):
  - report-link confirmation,
  - or Telegram report attachment (if connector/session ready),
  - or Paperclip dry-run task.
4. Codex will then verify:
  - 'accepted\_for\_execution=true'
  - audit event present
  - session expiration behavior
  - out-of-scope action still blocked

#### ## Files Changed

- 'src/lib/migrations.ts'
- 'runtime/day-06-phase-3-bridge-session-persistence-approved-proof.md'
- 'runtime/day-06-phase-3-bridge-session-persistence-approved-proof.pdf'

#### ## Services

- No service restart in this phase yet.
- Migration is applied on next runtime start/deploy cycle.

#### ## Commits

- Pending (this phase included implementation + test + report only in current working tree).

#### ## Rollback

- 'git revert <commit\_sha\_for\_migration\_change>'

#### ## No-Secrets Confirmation

- No secret values printed.
- No token values printed.
- No auth files printed.
- No '.env' changes.

#### ## Updated Percentage

- Bridge Session readiness improved (schema/persistence lane),
- but Bridge Session overall remains PARTIAL until one approved scoped execution is live-proven.

#### ## Exact Next Step

Proceed to Day 06 Phase 4 (Telegram PDF live attachment proof) and attempt one Bridge-scoped send if owner approval/session is available; otherwise return exact blocker with owner action package.
