Day 06 Phase 7 â AgentMail Status and Send Path

Objective

Classify AgentMail incoming/outgoing status with exact gating and no fake send claims.

Result

PARTIAL / BLOCKED (honest).

Evidence and Findings

1. Protected bridge/provider routes currently require authenticated session ('401' when unauthenticated in active runtime).
2. AgentMail execution path exists in the execution gateway as a registered adapter action:
 - 'agentmail.send'
3. Current adapter behavior is intentionally blocked until connector/send runner is configured:
 - blocked reason: 'agentmail_send_connector_not_configured' (or invocation-adapter equivalent)
4. Safety gates are preserved:
 - Bridge Session required,
 - owner approval required,
 - no email sent when blocked,
 - no fake done.

Blockers

- 'agentmail_send_connector_not_configured'
- 'active_bridge_session_required'
- 'owner_approval_pending'
- 'authenticated_local_smoke_blocked' (current runtime session context unavailable for protected route checks)

Allowed-Domain Send Status

- Domain-restriction policy is represented in gateway policy tests/contracts.
- Live allowed-domain send proof not executed in this phase.

Safety Confirmation

- No unrestricted external send attempted.
- No token values printed.
- No credential files printed.
- No '.env' changes.

Files Changed

- 'runtime/day-06-phase-7-agentmail-status-send-path.md'
- 'runtime/day-06-phase-7-agentmail-status-send-path.pdf'

Updated Percentage

- AgentMail remains PARTIAL/BLOCKED until one approved allowed-domain send is live-proven.

Exact Next Step

Once authenticated operator session + Bridge scope are available, run one allowed-domain test send and verify audit + no out-of-scope send.
