Day 06 Phase 9 â OpenClaw+ Doctor Issue Reduction

Objective

Reduce OpenClaw+ doctor issue count with safe non-destructive fixes and exact blocker accounting

.

Result

PARTIAL (no live doctor reduction completed in this phase).

Actions Executed

1. Attempted authenticated doctor route access:

- 'GET /api/openclaw/doctor'

2. Captured current access blocker.

3. Applied related safe persistence improvement in this Day 06 batch:

- Bridge approval/audit persistence migration ('053_bridge_approval_audit_persistence') to re move one downstream session blocker chain affecting OpenClaw+ execution governance lanes.

Evidence

- Doctor route call returned '401 Unauthorized' without authenticated operator/session context.
- No doctor issue-count delta could be safely claimed from runtime in this phase.

Blockers

- 'authenticated_local_smoke_blocked'

- owner/session-auth dependency for protected doctor route

Safe Fixes Applied (Non-Destructive)

- Added missing Bridge approval/audit persistence tables migration to support audited Bridge Session execution prerequisites.

- No deletions of agents/skills/memory/reports/governance.

- No '.env' changes.

Files Changed

- 'src/lib/migrations.ts'

- 'runtime/day-06-phase-9-openclaw-doctor-issue-reduction.md'

- 'runtime/day-06-phase-9-openclaw-doctor-issue-reduction.pdf'

Tests

- 'pnpm run typecheck' -> PASS

- targeted bridge/session tests -> PASS

Updated Percentage

- OpenClaw+ remains PARTIAL until authenticated doctor count before/after is captured.

Exact Next Step

Acquire authenticated operator session, run doctor, capture exact issue list/count, apply safe subset fixes, rerun doctor, and record before/after counts.
