

Day 03 Phase 9 — OpenClaw+ Doctor Reachability

Objective

Fix or precisely document OpenClaw+ doctor reachability and run health check safely.

Actions

1. Traced Mission Control OpenClaw+ doctor route dependency to the OpenClaw+ CLI binary lookup.
2. Confirmed failure mode was CLI reachability from service runtime context.
3. Added a safe user-local executable wrapper so `openclaw` resolves for Mission Control service runtime.
4. Re-ran OpenClaw+ doctor via API after reachability fix.
5. Did **not** run destructive cleanup/fix routines.

Commands / Routes Used

- `GET /api/openclaw/doctor` (before and after reachability repair)
- OpenClaw+ CLI doctor invocation in service runtime context

Proof

- Before repair: `GET /api/openclaw/doctor` returned non-success (`400`) due runtime CLI reachability gap.
- After repair: `GET /api/openclaw/doctor` returned `200` with parsed doctor output.
- Doctor output truth:
 - reachable: yes
 - healthy: no
 - issues_count: 18
 - remaining findings include plugin/runtime profile and execution hardening items.

Files Changed

- `runtime/day-03-phase-9-openclaw-doctor-reachability.md`

Services

- OpenClaw+ doctor API route now reachable.

Tests

- Reachability test: PASS.
- Health target: PARTIAL (doctor still reports unresolved issues).

Commits

- None in this phase.

Blockers

- ``openclaw_doctor_reports_remaining_unhealthy_items``

Rollback

- Remove user-local wrapper only if an alternative approved binary resolution path is deployed.

No-Secrets Confirmation

- No credential values or auth files were printed.
- No ``.env`` changes were made.

Updated Percentage

- OpenClaw+ increases slightly from prior PARTIAL state because doctor reachability is restored, but health is not fully GO.

Exact Next Step

- Remediate doctor findings with safe, non-destructive fixes only; re-run doctor until issue count is reduced and remaining host/admin items are explicitly documented.
